Connection

Download
Connection

- The fastest Internet available—Gigabit connectivity!
- No caps on bandwidth usage and no throttling of speeds.
- FTTH allows for better telecommuting, business startups, health services and educational learning.

Real Estate Value

A home or building connected to a reliable Fiber to the Home (FTTH) network:

- Can add up to 8% of value to a home.
- Renters are willing to pay 8% to 15% more for a connected home.

Reliability

- Residential fiber “modems,” known as gateways, are far more reliable than DSL or cable equipment.
- FTTH systems use new infrastructure instead of cannibalizing older wiring for internet, like DSL or cable.
- Seasonal weather changes like extreme temperatures do not affect the fiber. Fiber does not corrode over time like existing communication systems.

Future-Proof

- FTTH systems are state-of-the-art and scale to higher speeds.
- If a new technology comes along in the future no updating of fiber is needed, only updating the electronics in home.
- Network electronics utilize far less power than existing systems, saving you money today and power for the future.
